Algebraic type theory*

Steve Awodey

 $\begin{array}{c} CMU \\ \texttt{awodey@cmu.edu} \end{array}$

A type theoretic universe $E \to U$ bears a certain algebraic structure resulting from the type-forming operations of unit type, identity type, dependent sum, and dependent product (as in [1]) which may be generalized to form the concept of a "Martin-Löf algebra". A free ML-algebra is then a model of type theory, perhaps with special properties. The general theory of such ML-algebras is then something like a proof-relevant version of the theory of Zermelo-Fraenkel algebras from the algebraic set theory of Joyal & Moerdijk [2]
